0-0-0-C-A-B: Working.

[00048] Deleting a connection is done in much the same way.

[00049] In order to avoid timing problems with other activities on the control registers, add and delete connection handling occurs only at specific timeslots.

[00050] Note: When adding a new connection, it is preferable to add the receive side before adding the transmit side since the receive side cares about the incoming TOS. For this reason, it is better to allocate the connection before receiving the new TOS level.

#### Incoming TOS Processing

[00051] Another important feature of TCM processing is the management of the incoming TOS (top of stack).

[00052] Again, the controller must execute a series of commands for each incoming TOS. The TOS for the Wrapper transmit side differs from that of the Wrapper receive side. On the transmit side, TOS values are received (decremented TOS) from the receive side. On the receive side, TOS values are received from the link. These TOS values are not the same as the ones received on the transmit side.

[00053] WRX (receive side):

- 1 WMT\_NEXT\_TOS
- 2 PROCESS\_HAMMING\_TOS
- 3 INCOMING\_TOS\_TREATMENT
- 4 UPDATE\_CONTROL\_REGISTERS
- 5 TRANSMIT\_DECREMENTED\_TOS

[00054] WAIT\_NEXT\_TOS: In this state, the controller waits for a specific predetermined timeslot. When the predetermined timeslot arrives,
